General Report about Phase 3

What is done:
- The Registration page is available and it also checks whether given username is unique.
- The Login page is working as well, if wrong credentials are given it does not let one to pass. It only lets when there are valid credentials.
- The scoreboard view is implemented.
- The game is also implemented.
- Cheat functionality is also implemented.

For more information about what is done please refer to the issue opened for this phase.

The problems we faced:
- The scoreboard view was working efficiently, however, as we proceeded to develop the game, it is somehow not working anymore. If one is really curious about whether it was working or not, he/she can go to commit #45aaff10fd

- We actually could not inject the scenes concurrently and the game is failed. There is only a view of the viruses and a female doctor shooting masks. Therefore, the game could not proceed. However, as mentioned in the specifications, we have 4 different types of viruses and some of them shoots.

- While debugging, it seems everything is correct but in practice it did not work as expected. We will study hard on the next phase and hopefully come up with a good game.

Note: The tests are done when these problems did not occur. The outcome of them might be different now. Also, we really worked hard on this phase and having such failure broke our motivation. Hopefully, we can figure the things out and any feedback is appreciated.
